

UK GOV. confirms Unvaccinated had lowest Mortality Rate per 100k in 2022

The UK government has just published a report that confirms Covid-19 vaccination is deadly, with figures showing mortality rates per 100,000 were lowest among the unvaccinated throughout the whole of 2022.

The report also reveals that the triple+ vaccinated accounted for 92% of COVID deaths.

The Government's report on vaccination raises serious questions about the efficacy and safety of the Covid-19 vaccines, and it proves that being vaccinated does not provide the protection that was promised. It instead does the opposite.

On the 21st of February 2023, a UK Government agency, known as the Office for National Statistics (ONS), published data on deaths by vaccination status in England up to 31st December 2022.

The overdue dataset from the ONS is titled '[*Deaths by Vaccination Status, England, 1 April 2021 to 31 December 2022*](#)', and it can be accessed on the ONS site [here](#), and downloaded [here](#).

Table 1 of the latest dataset contains figures on the mortality rates by vaccination status for all-cause deaths not involving Covid-19 and we have extracted the data and produced the following two charts –

[Source Data](#)

As you can see from the above, the mortality rate per 100,00 among the unvaccinated remained at pretty much the same level throughout the entirety of 2022, with no major increases, or dips.

But what's concerning is the fact that the unvaccinated mortality rate was lower than the one dose vaccinated and two dose vaccinated for the entire year. And the 3+ dose vaccinated for 8 months of the year.

However, if it were not for the fact the 3 dose + data includes those who have also had a fourth, or even fifth dose, we fully believe that the mortality rate would still be higher than the unvaccinated mortality rate for the entire year.

As you can see from the following chart, the fall is far too dramatic –

And it coincides with the rollout of the Autumn 2022 Booster campaign as confirmed in a [press release published by the JCVI](#) –

Press release

JCVI advises an autumn COVID-19 vaccine booster

JCVI makes interim recommendations to government on the COVID-19 vaccination programme for 2023.

The 2022 COVID-19 autumn booster vaccination campaign commenced in early September last year. The most recent coverage data (15 January 2023) of the autumn booster programme in those aged 50 years and over is 64.5% and 82.4% in those aged 75 years and over. By the end of summer 2022, the coverage of the 2022 spring booster programme was 77.3% in those aged 75 years and over.

Following high uptake rates for the initial (third) booster dose of COVID-19 vaccine in December 2021, further uptake has been low at less than 0.1% per week since April 2022 in all eligible people under 50 years of age.

Similarly, uptake of primary course vaccination, which has been widely available since 2021, has plateaued in recent months across all age groups.

Source

This means the data for mortality rates on those who had 3 doses after Spring 2022 is unreliable because it includes a small portion of people who had a fourth dose in Spring and an even smaller portion of people who had a fifth dose in the Autumn.

The only reason the data has been published this way is that it helps the Government to present the illusion that mortality rates per 100,000 are now in line/lower than mortality rates among the unvaccinated.

But as you can see from the following chart, which includes stable and reliable data, the opposite is true.

Mortality Rates per 100,000 by COVID Vaccination Status for All Cause Deaths excluding Covid-19 in England, 1st January to 31st December 2022

Covid-19 vaccination increases a person's risk of death. The largest increase recorded so far was in March 2022, which equated to 276%.

This is, therefore, proof that Covid-19 vaccination has been killing people.

And it may explain why the same dataset reveals the fully vaccinated population accounted for 92% of all Covid-19 deaths throughout the year 2022.

COVID-19 Deaths by Vaccination Status in England, 1st Jan. 2022 to 31st Dec. 2022

[Source Data](#)

And despite a fifth dose of the Covid-19 injection being offered to the public before the end of the year, it's those who had the most doses that account for the majority of deaths among the vaccinated.

Cause of Death	Year	Month	Vaccination status	Count of deaths
Deaths involving COVID-	2022	October	Unvaccinated	125
Deaths involving COVID-	2022	October	First dose, less than 21 days ago	0
Deaths involving COVID-	2022	October	First dose, at least 21 days ago	24
Deaths involving COVID-	2022	October	Second dose, less than 21 days ago	0
Deaths involving COVID-	2022	October	Second dose, between 21 days and 6 months	1
Deaths involving COVID-	2022	October	Second dose, at least 6 months ago	110
Deaths involving COVID-	2022	October	Third dose or booster, less than 21 days ago	0
Deaths involving COVID-	2022	October	Third dose or booster, at least 21 days ago	2,146
Deaths involving COVID-	2022	October	Ever vaccinated	2,281

[Source Data](#)

In all, there were 28,041 Covid-19 deaths in England between 1st January 2022 and 31st December 2022, and shockingly, 25,758 of those deaths were among the fully vaccinated population, while just 2,273 deaths were among the unvaccinated population.

These aren't the kind of figures you would expect to see if the Covid-19 injections really are up to 95% effective at preventing death, are they?

With news like this being swept under the rug by the mainstream media, it makes you wonder what else we are not being told...
